HELPFUL HINTS

How do you prefer to receive art for printing?

- We work exclusively with Press Ready or Print Quality PDFs with bleeds and trim marks built in.

How much bleed do you need?

- 1/8-inch or 3mm for bleed is perfect. "Bleed" is the image that extends 1/8-inch beyond the trimmed edge of the final product.

"Best practices" for preparing print files:

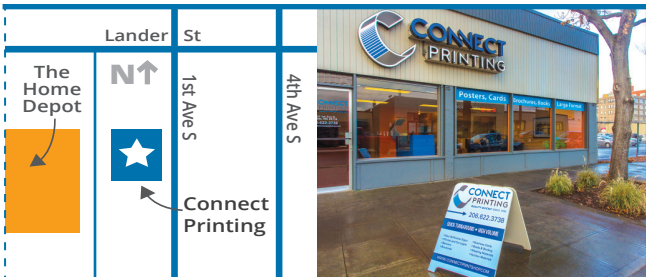

- Work exclusively in the CMYK color space when selecting images and building files for printing.
- Files supplied for print should be 1-up only.
- 300 dpi at final print size is the preferred lowest resolution for all placed images.
- Best practice for all print documents from all sources including Canva and Chat GPT is to supply fully flattened pdf documents.

Native files?

- We prefer not to receive "native files."

Color Matching

- Provide actual PMS numbers for color matching of CMYK files.
- Provide printed sample for color matching of logo or branding colors.
