

## Section 1: Hero – Lead with the Pain Point

What's happening here:

**Immediate clarity:** The split-screen comparison shows the problem (left) vs. solution (right) in 2 seconds. The headline "Copy what you mean. Not what breaks." is conversational and benefit-driven; no jargon

**Visual contrast:** Broken red selection (frustration) vs. electric blue success (relief)

**CTAs are clear:** Primary action is Chrome install, secondary allows choice

**Why this works:** Visitors instantly see the value without reading a paragraph. The before/after format is universal and sticky.

## 🔥 Section 2: Smart Symbol Selection (Scroll Feature #1)

What's happening here:

**Developer-first showcase:** Code editor aesthetic speaks directly to your technical audience. The variable name `API_KEY_2024` includes underscores and numbers (classic pain point)

**Copy is action-oriented:** "Grab entire variables, file paths, and URLs" ...lists specific use cases

**Subtle grid background:** Adds depth without distraction

**Scroll behavior:** As user scrolls down, this code editor would fade in and the selection would animate (like someone just double-clicked it).

### ⚡ Section 3: Quick Copy Button (Scroll Feature #2)

What's happening here:

**Visual metaphor:** The text being "pulled into" the copy button shows the action without words. The glow effect makes the button feel interactive even in a static mockup

**Copy eliminates friction:** "No right-click menus. No keyboard gymnastics" = time saved

**Scroll behavior:** Button would appear with a subtle pulse, then the text would animate into it like it's being absorbed. Satisfying micro-interaction.

## 🔗 Section 4: Select Links Without Clicking (Scroll Feature #3)

What's happening here:

**Glassmorphic highlight on the URL** shows selection without triggering the link

**Solves a common frustration:** Everyone's accidentally clicked a link when trying to copy it

**Clean wireframe approach:** Keeps focus on the feature, not unnecessary design details

**Scroll behavior:** The cursor would move into position, hover, and the translucent blue highlight would appear. Simple, effective.

## ⚙️ Section 5: Customizable Symbols (Scroll Feature #4)

What's happening here:

**Neumorphic toggles** are tactile and modern; feels premium

**Each symbol is clearly labeled:** No guessing what - or / means

**Live preview:** Shows that changes happen in real-time (power user feature)

**Scroll behavior:** Settings panel would slide in from the side, then one toggle would flip with a smooth animation, and the preview would update.

## Section 6: Dual Audience Pivot

What's happening here: Side-by-side cards acknowledge both user personas without forcing them to wade through irrelevant info

**"For Everyone" uses familiar examples:** file names, email addresses

**"For Developers" speaks their language:** API keys, function names, code syntax

Gradient borders add subtle polish without over-designing

**Interactive touch:** On hover, each card could scale slightly and show a quick animated demo specific to that audience.

## 🚀 Section 7: Final CTA with Trust Signals

What's happening here:

**Urgency without pressure:** "Stop fighting your browser" reframes the problem as a daily frustration

**Clear CTAs:** Multiple browser options (Chrome, Firefox, Edge) reduce friction

Trust badges: Star ratings provide social proof

**Security reassurance:** "Free forever. No account required." removes objections

**Why this works:** After seeing all the features, this is where you close the deal. The headline is emotional (fighting = frustration), and the CTAs are zero-commitment.
